

Majhi OS — Delivery Model Blueprint

A detailed operational delivery framework for implementing hiring infrastructure across recruiting workflows.

Majhi OS should not be delivered like traditional recruiting software or self-serve SaaS tooling. The system is positioned as operational hiring infrastructure — meaning the onboarding, activation, workflow orchestration, governance, and visibility layers must feel operationally embedded rather than merely installed. This document outlines the ideal delivery model from first engagement through infrastructure-scale deployment.

Phase 1 — Strategic Discovery & Operational Mapping

- Understand the client's current recruiting workflow architecture.
- Map sourcing channels, recruiter coordination patterns, outreach logic, and mandate management.
- Identify operational bottlenecks, visibility gaps, workflow fragmentation, and reporting delays.
- Assess recruiter load distribution and hiring velocity issues.
- Evaluate tooling fragmentation across ATS, CRM, outreach systems, and spreadsheets.

Deliverables:

- Operational workflow map
- Fragmentation analysis
- Visibility gap assessment
- Initial hiring infrastructure blueprint

Phase 2 — Infrastructure Configuration & Hiring Lane Setup

- Create hiring lanes aligned to the client's mandate structure.
- Configure recruiter assignment logic and mandate ownership.
- Set up dossier templates, telemetry layers, and operational alerts.
- Define escalation rules, governance checkpoints, and review workflows.
- Configure intake normalization and candidate ingestion rules.

Goal:

Operationalize recruiting execution into a structured workflow system.

Phase 3 — Candidate Intake Activation

- Enable LinkedIn PDF ingestion and resume uploads.
- Normalize candidate profiles into structured operational objects.
- Run duplicate detection and identity stitching workflows.
- Generate evidence-backed dossiers automatically.
- Assign mandate alignment scoring and risk flags.

The intake layer becomes the controlled operational gateway into the system.

Phase 4 — Workflow Orchestration Activation

- Activate recruiter workflows and operational telemetry.
- Enable outreach sequencing and response monitoring.
- Track recruiter actions and pipeline progression.
- Surface stall detection, funnel decay alerts, and mandate health states.
- Initiate escalation logic when execution risk increases.

At this stage the system transitions from passive software into active operational infrastructure.

Phase 5 — Operational Visibility Layer

- Leadership gains real-time visibility across active mandates.
- Monitor recruiter load, pipeline velocity, outreach quality, and shortlist readiness.
- Track execution bottlenecks and operational risk states.
- Surface recovery recommendations and escalation workflows.

This layer becomes the command surface for recruiting execution.

Phase 6 — Governance & Human Oversight

- Enable recruiter overrides and human review checkpoints.

- Maintain audit logs across all workflow actions.
- Track confidence levels and evidence attribution.
- Ensure all operational decisions remain traceable and reviewable.

Infrastructure trust depends on controlled execution and human governance.

Phase 7 — Operational Reviews & Optimization

- Conduct recurring workflow performance reviews.
- Analyze funnel decay, response patterns, and mandate velocity.
- Refine outreach logic and recruiter workflows.
- Optimize execution throughput and operational coordination.

Majhi OS evolves continuously alongside the recruiting operation itself.

Operational Delivery Philosophy

Majhi OS should be delivered as an operational transformation layer rather than a conventional SaaS product. The objective is not:

- tool deployment
- recruiter automation
- dashboard access

The objective is:

- operational visibility
- workflow orchestration
- execution compression
- evidence-backed hiring intelligence
- infrastructure-grade recruiting coordination

Clients should feel that Majhi OS operationalizes recruiting execution rather than simply digitizing workflows.

Ideal Client Experience

By the end of onboarding, clients should experience the following transition: Fragmented recruiting operation ↓ Unified execution visibility ↓ Controlled intake workflows ↓ Evidence-backed dossiers ↓ Operational telemetry ↓ Real-time mandate health visibility ↓ Infrastructure-grade recruiting coordination

Recommended Commercial Structure

Stage	Duration	Primary Objective
Pilot Deployment	30–60 days	Prove workflow compression and visibility gains
Operational Rollout	60–120 days	Expand recruiter and mandate coverage
Infrastructure Deployment	Ongoing	Establish Majhi OS as operational command layer

Closing Perspective

Majhi OS is strongest when delivered as operational infrastructure rather than recruiter tooling. The delivery model should emphasize:

- visibility
- orchestration
- governance
- execution reliability

- operational intelligence The system succeeds when clients no longer feel they are managing fragmented hiring workflows manually — but instead operating through a connected, observable recruiting infrastructure layer.
